### 3. CALIBRATION PROCEDURE

#### 3.1 Preparations Before Power-up

- (1) Confirm that the power source line doesn't touch GND before turning on a power source.
  
- (2) Confirm that the position of the a voltage selector and a regular fuse are being used.
  
- (3) Connect it in the regular power source line after you confirm that the power switch of the product is off.
  
- (4) 30 minutes and more warm-up is required under the condition that the unit is covered by case before you adjust it.  
The measuring equipment used for the adjustment also need 30 minutes and more warm-up.
  
- (5) Use the Generator 1 and 2 for the Input A. And, use the terminating resistor of 50  $\Omega$  when a standard signal generator is connected.  
The terminating resistor of 50  $\Omega$  isn't used for Input B.
